

RESTRICTED

CHAPTER V

MISCELLANEOUS AIR- WARFARE MISSILES

SECTION 26

GENERAL

2601. Many air- warfare missiles are small, a number have parachute attachments and some are deigned to land in a shallow glide. A large proportion of which fail to explode are therefore, likely to be found on or near the surface. Some of these may be dangerous to approach or disturb. It is imperative that all troops in war should be familiar with the appearance of as many as possible of the air-warfare missiles in use.

2602. Certain of the larger missiles are likely to break up on impact. In order that dangerous complaints may be recognized as such, it will be necessary as new missiles are produced to study their construction and methods of operation.

2603. Again it must be emphasized that this pamphlet cannot give detailed description of missiles likely to be met in the future. It aims merely at giving an idea of the diversity of the missiles used in the past, the details of construction, filling and fuzing of certain basic types, and the reconnaissance problems and safety measures likely to be associated with them.

2604-2700 Reserved.
